

INDIAN NETFLIX YOUTUBE CONTENT PERFORMANCE ANALYSIS

1. Executive Summary

This project analyzes Indian Netflix YouTube video performance data to understand the factors influencing views, engagement, content success, publishing strategy, and metadata optimization.

Using **Power BI**, the analysis explored video-level performance across content type, publishing time, publishing day, video duration, tags, titles, views, likes, and comments.

Overall Performance

KPI	Value
Total Videos	5K
Total Views	11 Billion
Average Views	2.15 Million
Engagement Rate	1.25%
Total Comments	3.40 Million
Total Likes	136.98 Million

The analysis indicates that **long-form content dominates total view generation**, while publishing strategy and metadata show meaningful patterns that can support better content decisions.

2. Business Objective

The primary objective of this project was to analyze Indian YouTube content performance and identify the factors associated with higher views and engagement.

Key Business Questions

The analysis focused on understanding:

1. Overall platform content performance.
2. Performance differences between Long and Short content.
3. Top-performing videos.
4. Video publishing frequency over time.
5. Best publishing hours.
6. Relationship between video duration and views/comments.

7. Relationship between views and comments.
8. Impact of tag count on video views.
9. Best publishing day based on engagement.
10. Impact of title length on video views.
11. Performance differences between videos with and without tags.
12. Most frequently used title and tag keywords.

3. Dataset Overview

The dataset contains Indian YouTube video-level information used to analyze content performance.

Key Data Elements

The analysis includes fields related to:

- Video Title
- Video ID
- Category
- Publishing Date
- Publishing Time
- Video Duration
- Content Type
- Views
- Likes
- Comments
- Tags
- Tag Count
- Title Length
- Publishing Day
- Publishing Hour

These attributes were transformed and analyzed to identify patterns in content performance.

4. Tools & Technologies Used

Tool	Purpose
Power BI	Data modeling, analysis, dashboard development
Power Query	Data cleaning and transformation
DAX	KPI calculations and analytical measures
Data Visualization	Business insights and storytelling

5. Data Preparation & Transformation

Data preparation was performed using **Power Query** before visualization.

Major Transformation Activities

- Checked and handled missing values.
- Cleaned text-based columns.
- Processed video titles.
- Split titles into individual keywords.
- Converted keywords to lowercase.
- Removed blank values.
- Trimmed unnecessary spaces.
- Removed common meaningless/stop words.
- Created keyword frequency analysis.
- Extracted publishing date-related attributes.
- Created content classification fields.
- Prepared tag-related metrics.
- Created analytical fields required for visualization.

Title Keyword Cleaning

For meaningful title keyword analysis, commonly occurring but analytically insignificant words were removed.

Examples included common words such as:

the, a, an, and, to, of, in, on, with, for, is, at, by, from

This improved the quality of keyword frequency analysis by focusing on meaningful content-related terms.

6. Dashboard Structure

The Power BI report consists of three main analytical pages.

Page 1 — Executive View

Purpose:- Provides a high-level summary of overall YouTube content performance.

Key KPIs

- Total Videos
- Total Views
- Average Views
- Engagement Rate
- Total Comments
- Total Likes

Key Performance Highlights

The dashboard also highlights:

- Top-performing content type
- Top-performing video
- Most frequently used title keyword
- Best publishing day

Supporting Visuals

- Total Views by Content Type
- Video Publishing Frequency Over Time
- Average Views by Publishing Hour

Business Value

This page enables stakeholders to quickly understand overall content performance without reviewing detailed charts.

Page 2 — Content Performance Analysis

Purpose :- Analyzes relationships between video characteristics and audience performance.

Key Analysis Areas.

Video Duration vs Views & Comments

Examines whether longer or shorter videos tend to generate higher views and audience interaction.

Views vs Comments

Analyzes the relationship between reach and audience interaction.

A positive relationship is generally visible, although extremely high-view videos can behave differently from typical videos.

Tag Count vs Video Views

Investigates whether adding more tags is associated with increased video views.

Engagement Rate by Publishing Day

Compares engagement performance across different days of the week.

Key Observation

The dashboard shows that **Thursday generated the highest engagement rate at approximately 1.82%.**

Other strong days include:

- Sunday — 1.52%
- Tuesday — 1.47%

However, publishing day should not be considered the only factor affecting performance.

Page 3 — Metadata & Content Optimization

Purpose :- Focuses on how metadata characteristics relate to video performance.

Analysis Areas

Title Length vs Video Views

Examines whether title length has a noticeable relationship with video views.

The visualization indicates that there is **no simple linear relationship where longer titles automatically generate more views.**

Some high-performing videos exist across different title lengths.

Videos With Tags vs Without Tags

The analysis shows:

Tag Status Performance Value

No Tags 3.41M

With Tags 2.15M

Important Interpretation

Videos without tags showed higher performance in this dataset.

However, this **does not prove that removing tags increases views.**

Other factors may influence the result, including:

- Channel popularity
- Video topic
- Existing audience
- Content quality
- Recommendation algorithm
- Publishing strategy

Therefore, the finding should be treated as an **observational insight rather than a causal conclusion**.

7. Key Findings

Finding 1 — Long-Form Content Dominates Total Views

Long-form videos generated significantly higher total views compared to Short content.

Observation

- Long content generated approximately **10.3 Billion views**
- Short content generated approximately **0.5 Billion views**

Insight

Long-form content appears to be the primary contributor to overall view volume in this dataset.

Recommendation

Content strategy should not focus exclusively on Shorts.

A balanced strategy could be:

- Long-form videos for major view generation.
- Short-form content for reach and discovery.
- Shorts used to promote long-form content.

Finding 2 — A Few Videos Generate Extremely High Views

The scatter plots reveal the presence of significant outliers.

Some individual videos generate exceptionally high view counts compared to the majority of videos.

Insight

YouTube performance follows an uneven distribution where a relatively small number of videos contribute disproportionately to total views.

Business Implication

Average performance alone may not accurately represent typical video performance.

Content teams should analyze:

- Median views
- Top-performing video characteristics
- Outlier content patterns

Finding 3 — Top Performing Video Reached Approximately 888M Views

The dashboard identifies:

Mighty Little Bheem

as the top-performing video with approximately:

888 Million Views

Insight

Exceptional performance may be associated with factors beyond basic metadata, including:

- Brand recognition
- Audience demand
- Content accessibility
- Entertainment value
- Distribution strength

Finding 4 — Publishing Day Influences Engagement Patterns

The engagement analysis shows noticeable variation across publishing days.

Highest Engagement Day

Thursday — 1.82%

Followed by:

- Sunday — 1.52%
- Tuesday — 1.47%

Recommendation

Content teams should test publishing schedules around historically strong engagement days.

However, the optimal schedule should be validated through controlled testing rather than relying only on historical averages.

Finding 5 — Publishing Time Shows Performance Variation

Average views vary across different publishing hours.

Certain hours demonstrate stronger average view performance than others.

Recommendation

Creators should:

1. Identify high-performing publishing time windows.
2. Test content releases within those windows.
3. Compare results across multiple weeks.
4. Adjust schedules based on audience behavior.

Finding 6 — More Tags Do Not Automatically Mean More Views

The tag count analysis does not indicate a simple relationship where increasing the number of tags consistently increases views.

Insight

Tag quantity is likely less important than:

- Tag relevance
- Content topic
- Audience interest

- Video quality
- Recommendation performance

Recommendation

Focus on **relevant metadata quality rather than excessive tag quantity**.

Finding 7 — Videos Without Tags Performed Better in the Dataset

Videos categorized without tags showed higher average performance than those with tags.

Critical Interpretation

This is a correlation, not proof of causation.

It would be incorrect to conclude:

"Tags reduce video views."

The dataset only shows that these groups performed differently.

Recommendation

Perform further controlled analysis by comparing similar:

- Categories
- Channels
- Publishing periods
- Content types

before making a strategic decision about tag usage.

Finding 8 — Title Length Alone Does Not Determine Success

The title length visualization contains successful videos across multiple title lengths.

Insight

Longer titles do not guarantee higher views.

Similarly, shorter titles do not guarantee better performance.

Recommendation

Prioritize:

- Clear messaging

- Search relevance
- Audience curiosity
- Strong keywords

instead of optimizing purely for title length.

Finding 9 — Views and Comments Show an Engagement Relationship

Videos receiving high views generally have greater opportunities to generate comments.

However, high reach does not always guarantee proportionally high engagement.

Insight

Views measure reach, while comments measure deeper audience interaction.

Recommendation

Track both metrics instead of evaluating success only through views.

Finding 10 — Keyword Patterns Reveal Content Themes

The keyword analysis shows strong concentration around terms such as:

- Netflix
- India
- Trailer
- Official
- Season
- Scene

Insight

Frequently used keywords reflect dominant content themes and promotional strategies.

Recommendation

Keyword analysis can support:

- SEO planning
- Title development
- Content categorization

- Trend identification

However, keyword frequency alone should not determine content strategy.

Conclusion

This project demonstrates how **Power BI can be used to transform Indian Netflix YouTube video-level data into actionable content strategy insights.**

The analysis found that content performance is influenced by multiple factors rather than a single variable. Long-form content contributed the majority of total views, engagement varied across publishing days, and metadata characteristics showed patterns worth investigating further.

A key analytical lesson from this project is that **high performance should not be attributed to a single factor without deeper testing.** Variables such as tags, title length, publishing time, and video duration should be interpreted alongside content quality, audience behavior, and channel influence.

The final dashboard provides stakeholders with an interactive platform to monitor:

- Overall content performance
- Content type effectiveness
- Engagement patterns
- Publishing strategy
- Metadata trends
- Keyword usage
